Increased efficiency through extended product lifespan

up to 50,000 hours with the new NARVA XL

When planning a lighting system, the purchase and operating costs play a decisive role. The cost of exchanging fluorescent lamps is a particularly important cost factor especially where the lights are fitted to a high ceiling, for example when lighting a high rack warehouse or where the lights are widely spaced, as in a tunnel.

Changing these lights may even require entire production lines to be shut down for safety reasons. In such cases, fluorescent lamps with an extended lifespan can quickly compensate for such additional costs and therefore it becomes economically more efficient to operate lighting systems using these lights.

Over the years, fewer lights will need to be replaced and thrown away. This therefore helps to reduce pressure on the environment.

Recommended uses for fluorescent lamps with an extended lifespan:

- high-ceilinged warehouses
- shopping centres
- tunnels
- billboards
- stations
- street lighting with fluorescent lamps

Costly and time-consuming: changing light bulbs inside tunnels. With NARVA XL fluorescent lamps, the interval between periods of required maintenance is significantly longer.

NARVA XL fluorescent lamps are available in a T8 and T5 design and in various different light colours.

NARVA XL fluorescent lamps in the T8 design have an average lifespan of 50,000 hours when operated with a warm-start electronic ballast and 28,000 hours with a conventional ballast and suitable starter, and with the 3B50 cycle.

NARVA XL fluorescent lamps in the T5 design have an average lifespan of 40,000 hours with the 3B50 cycle when operated with a warm-start electronic ballast.

NARVA offers fluorescent lamps with an extended lifespan in selected colours as part of its COLOURLUX plus series. These lights are also available in other colours of the COLOURLUX plus series and in many special lighting colours on request.

We reserve the right to make modifications without notice.
